

## **Battery Operated Digital Photo Frames Allow Us To Display Our Memories The Modern Way**

**Melbourne, Victoria, Australia - 25 November 2011** – Battery Operated Digital Photo Frame, a rising new company in selling digital photo frames, released today a special issue on the new trend in viewing our photographs. This short paper is in e-book format and is available for free to inform people that memories are no longer bounded by films and developed pictures stuck in boring frames.

Gone are the days when we wait for a 36-shot film roll to be developed, those times when we still did not have the option as to which photos to save and which ones to delete. Hard copies of photographs were then kept in photo albums, scrap books and old picture frames. And they would stay there until such time that the acid in the photo paper began to have a chemical reaction and create discoloration on your photos.

Thanks to modern technology, digital photo frames are now available in the market. Unlike the old-fashioned picture frames, digital photo frames allow us to display an entire album of photos in a slideshow. Another great feature of digital frames are their ability to access the internet and display photos from your email or photo sharing sites. They are also energy efficient and environment friendly as they run on batteries.

Emily Williams, a scrapbooking club founder, says, *“At first, I was hesitant to get a digital photo frame. But when I read this special issue, I began to understand how this technology still fulfills your nostalgic moments,”* and Daniel Johnson, an application developer from Melbourne, reckons *“I highly recommend this special issue to everyone. Digital photo frames are now the perfect way to reminisce old memories and display new ones.”*

Through this special issue, [Battery Operated Digital Photo Frames](#) let us look back on our memories in a different yet still sentimental way. It contains a story on our fondness in capturing our life's special moments, our various ways of storing and keeping them, and the modern style of displaying them.

Memories are not just meant to be kept in the box, they are meant to be displayed and visited once in a while. To get a free copy of this issue, please visit <http://batteryoperateddigitalphotoframe.com/>.
